

Greenhouse gases

By Moira and Stefan

What are greenhouse gases?

Greenhouse gases are gases that build up the ozone layer (some of the gases are water vapour, carbon dioxide, nitrous oxide and methane) In our atmosphere they help keep the world warm. Without them earth would be a freezing waste land!

How does the greenhouse effect work?

The greenhouse effect is when sunlight travels to the earth, and the sunlight reflects off the earth and only some of the sunlight escapes the atmosphere and the greenhouse gases trap the rest of the and it warms the world.
